SUMMARY

Backend developer with 5+ years of freelance experience building Node.js and Python services, APIs and automation, now building data-heavy backend systems for a US pharmacy chain on Azure: serverless pipelines, system-to-system data syncs, and a Node.js + React internal web app on Azure App Service. Unusually strong in SQL and data modeling.

SKILLS

Languages: JavaScript, TypeScript, Python, SQL (T-SQL), Java

Backend: Node.js (Express), Flask, REST APIs, webhooks, authentication & authorization, scheduled jobs, third-party API integration

Databases: SQL Server / Azure SQL, MySQL, MongoDB, SQLite; schema design, stored procedures, incremental loads, change tracking

Cloud & DevOps: Azure (App Service, Functions, Data Factory, VNet integration), Linux, Docker, Git/GitHub, self-hosted Proxmox

Frontend: React, TypeScript

EXPERIENCE

Data Analyst, OrionTCS

Jun 2025 – Present

Backend and data engineering for a US pharmacy chain (retail and long-term care pharmacies)

- Building the **Pharmacy Visit Tool**, an internal web app for pharmacy reps: **Node.js** backend and **React** frontend on **Azure App Service** (Node 22, Linux), reaching the private data warehouse through VNet integration; implementing sign-in for company accounts.
- Built serverless pipelines on **Azure Functions** that replaced manual internal and external reporting, saving an estimated 20+ hours of manual work every week.
- Designed a warehouse-to-**Zoho CRM** sync engine: each run diffs live CRM state against an expected-state table and queues create/update/repair/archive/merge actions through an outbox, with human approval for destructive changes. Fuzzy matching recovered **5,000+** accounts that would have been duplicated. Building a React review console for the weekly approvals.
- Built an incremental delta feed of transaction data to a partner platform (**Azure Data Factory** → **SFTP**): per-row insert/update/sync timestamps for change detection, and group-level replace semantics so re-sends are idempotent. Fixed false deletes by redefining the record key after finding upstream IDs change on claim re-adjudication.
- Designed patient-identity matching between a real-time partner system and the one-day-delayed warehouse, so only one system ever mints global patient IDs.
- Wrote business logic separating final sales from non-sale events across billing and transaction data; refactored duplicated logic from four stored procedures into one inline table-valued function.

Freelance Full Stack Developer

Apr 2019 – Jan 2025

- Delivered 200+ projects for clients worldwide, building backend services and full-stack apps in **Node.js**, **Python** and **Java**.
- Built bots, automation and verification/auth tools for Discord, Web3 and gaming communities, integrating Discord, Twitter, Twitch and Google APIs.
- Built dashboards, logging systems and REST APIs for client platforms with large user bases.

PROJECTS

Home Lab Server | Proxmox, Linux, Docker, LXC

- Self-hosted server running containers and VMs (NAS, media server, Home Assistant, Docker services, CUPS print server); handled GPU passthrough and recovered data from a failing disk.

EDUCATION

Master of Computer Applications (MCA), Amity University

Expected 2027

Bachelor of Business Administration (BBA), Jain University

2025
